

Practice Exercise - Private Blockchain

In this week's session we covered setting up the private blockchain and performed some experiments.

In this week practice exercise we can implement following things:

- Learn commands to understand how gas is used and consumed. Can you modify a normal transaction call to send a higher gas price, so that your transaction gets preference in a congestion scenario?
- We did a simple transaction for currency transfer. Can you do a simple contract creation using the same command? See the docs below for parameters that can be used.
